I . Course Information

1. Research Groups

1. Department of Neurology	Prof. Hiroaki Adachi
Research project: Mechanism of neurodegenerative disorders and related molecules with the aim of developing therapies Neurodegenerative diseases (NDDs), including polyglutamine diseases and motor neuron diseases are a group of intractable diseases that significantly affect human health. To date, the pathogenesis of NDDs is still poorly understood and effective disease-modifying therapies for NDDs have not been totally established. NDDs share the common morphological characteristic of the deposition of abnormal proteins in the nervous system, including neurons. In this study, we investigate molecular mechanisms that regulate the decrease of pathogenic species and aim to elucidate how those therapeutic process contributes to ameliorate the pathology of NDDs. We also elucidate the role of protein quality control system and its related molecules in the removal of abnormal toxic proteins.
